Market commentary

Vanguard LifeStrategy® 40% Equity MPS Classic

As at 30 June 2025

Highlights

1
UK employment weakened.

2
The European Central Bank cut its interest rate as inflation fell.

3
Tariffs weighed on US growth.

In Q2 2025, trade and policy uncertainty dominated headlines. Trade distortions caused economic activity to soften in the US but improve in the euro area and the UK. While inflation fell below target in the euro area and was benign in the US, it remained elevated in the UK. During the quarter, the European Central Bank (ECB) and the Bank of England (BoE) cut their key lending rates, while the US Federal Reserve (Fed) kept rates unchanged.

In the UK, growth expanded by 0.7% (quarter-on-quarter) in Q1, while Q2 survey data suggested the uptick was due to one-off effects. Employment showed signs of cooling, with the unemployment rate edging up. Annual headline inflation rose to 3.4% in May, up from March's 2.6%. Despite this, the BoE cut interest rates from 4.50% to 4.25% in May on economic growth concerns.

Euro area economic activity expanded by 0.6% (quarter-on-quarter) in Q1. As in the UK, the growth uptick was due to one-off trade distortions, as recent survey data pointed to a

Source: Vanguard and Bloomberg, as at 23 June 2025.

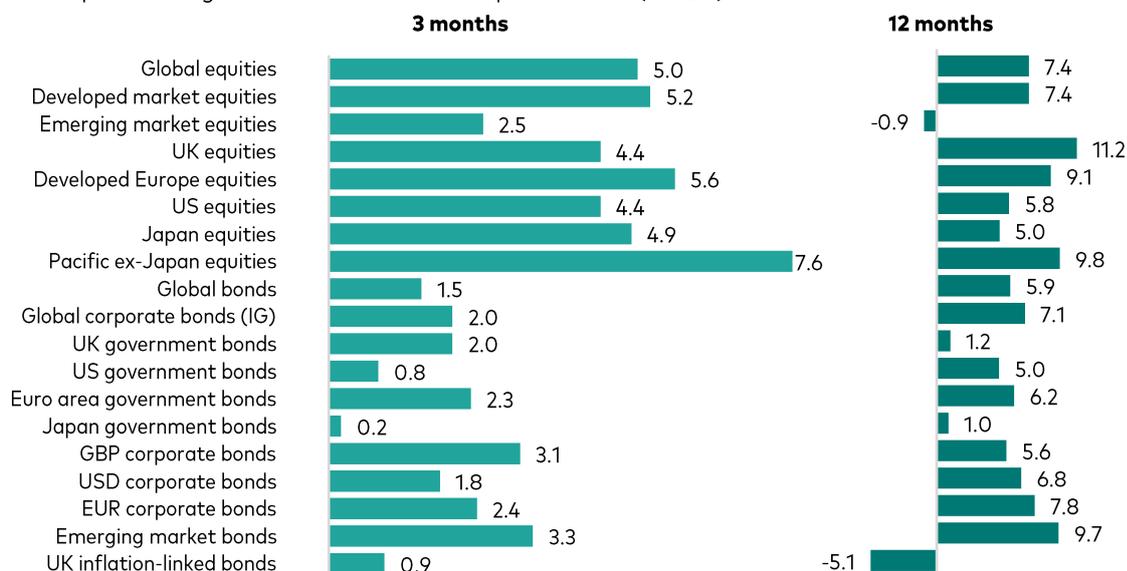

return to more modest growth in Q2. With headline inflation falling to 1.9% in March, below the ECB's 2% target, the ECB cut its policy rate twice to 2.0% from 2.5%.

Lastly, the US economy contracted by 0.2% (quarter-on-quarter, annualised) in Q1. Elevated policy uncertainty, trade tensions and the front-loading of imports all weighed on economic activity. Survey indicators suggested a marginal rebound in Q2. Tariffs have yet to materially impact inflation, with the Fed's preferred inflation measure, the annual Core Personal Consumption Expenditures (PCE) Index, edging down from 2.7% in March to 2.5% in May. Similarly, headline PCE fell from 2.3% to 2.1% over the same period. With the economic outlook clouded by uncertainty, the Fed opted to keep interest rates unchanged, leaving the federal funds target range at 4.25-4.50% at the end of Q2.

Portfolio commentary

Vanguard LifeStrategy® 40% Equity MPS Classic

As at 30 June 2025

Highlights

- 1** The LifeStrategy 40% Equity MPS Classic portfolio recorded a return of 2.78%.
- 2** US equities rebounded from a steep, tariff-led early quarter sell-off.
- 3** UK corporate bonds outperformed most other bond markets.

The LifeStrategy 40% Equity MPS Classic portfolio recorded a return of 2.78% in the second quarter of 2025.

The fixed income portion of the portfolio, contributed positively to performance, primarily through its exposure to global bonds. UK gilts and corporate bonds also made a notable contribution. Total equity exposure made a significant positive contribution to performance, with the US the main contributor. Holdings in UK, developed Europe (ex-UK) and emerging market equities also contributed positively.

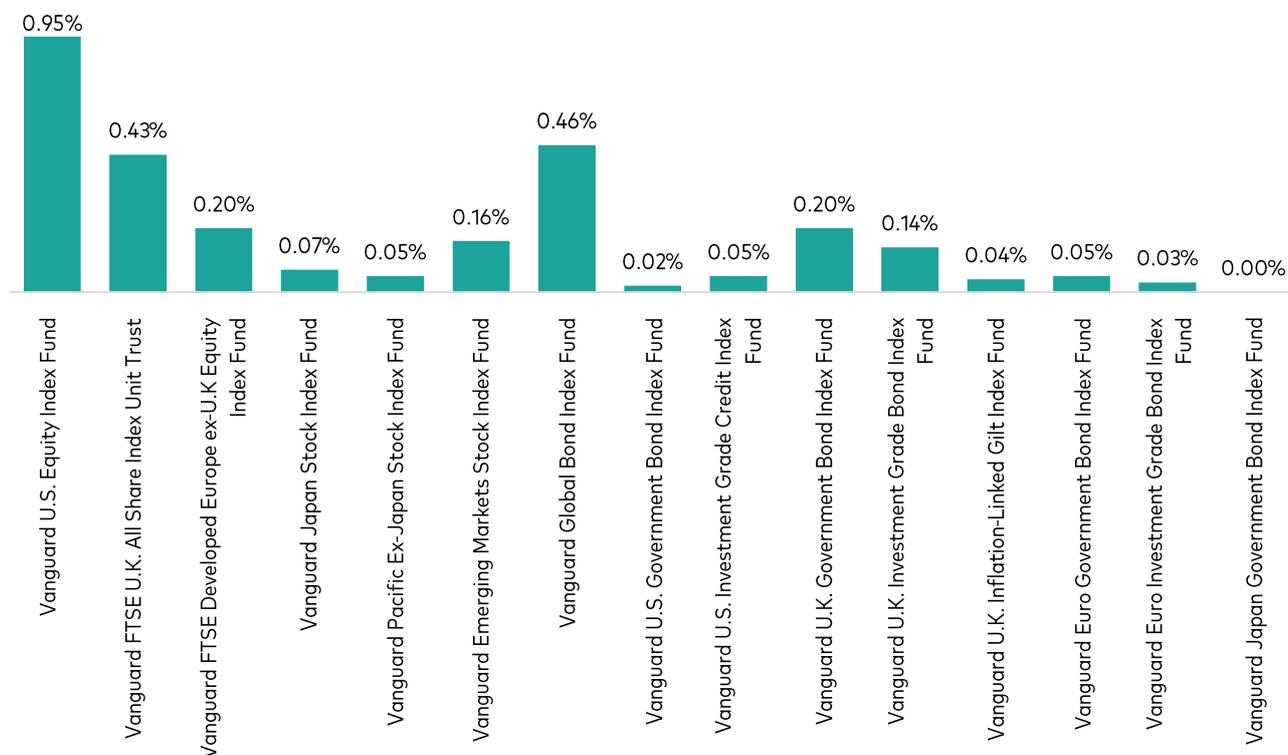

In fixed income markets, the quarter marked a shift in investor focus from central bank actions to broader fiscal and credit fundamentals. Geopolitical and trade tensions eased, while inflation showed signs of softening. Investment grade bonds made healthy gains, particularly UK and euro area corporate debt. Credit spreads tightening was supported by an attractive starting yield and a relative lack of supply. Euro area government bonds also made good progress, helped by European Central Bank rate cuts and softening inflation. Meanwhile, UK gilts delivered a robust quarterly return, driven by a high starting yield

and a Bank of England rate cut. In the US, the Federal Reserve maintained a cautious stance. However, growing concerns about US government debt sustainability was realised when the country's sovereign debt rating was downgraded. US treasury performance lagged other major government bond markets.

In equities, the US market rebounded strongly in Q2 (in US dollar terms), recovering from a steep sell-off early in the quarter sparked by the announcement of new trade tariffs. US market confidence was buoyed by positive news on the economy, corporate earnings and easing trade tensions following the initial tariff announcements. Euro area equity markets gains were supported by two interest cuts, plans to increase defence spending and easing trade tensions. Elsewhere, the softer US dollar provided broad support for emerging market equities and Japanese shares rose on corporate reforms and trade talks progress, while UK equities gained on positive Q1 2025 economic growth, new trade deals and an interest-rate cut.

Key investment risks

The value of equities and bonds can be affected by factors such as stock market movements, interest rates, credit spreads and volatility. Other driving factors include political, economic news, company earnings and significant corporate events. Movements in currency exchange rates can adversely affect the return of your investment.

Asset-Backed Risk. Investments in asset-backed securities, which are financial instruments backed by pools of assets such as mortgages, car loans, student loans or credit card receivables. The primary risk is borrowers defaulting on their loans, leading to investments losing value.

Credit Risk. This is the risk that a borrower or counterparty will default on their financial obligations, leading to a loss for the lender or investor. It is essentially the risk of not being repaid. Creditworthiness and economic conditions influence credit risk.

Foreign Investment Risk. This includes political risk (changes in government policies or instability), currency risk (foreign currency exchange rates) and economic risk (differences in economic

conditions and policies). All these can affect the value and performance of overseas investments.

Liquidity Risk. This is the risk of not being able to convert an investment into cash without a significant loss. Because the asset is illiquid, it is difficult to sell quickly. This hinders minimizing investment loss. Liquidity risk can be influenced by market conditions and the specific nature of the investment. Examples include real estate, private assets and emerging markets.

Market Risk. This is the potential for loss from market price movements. These include changes in interest rates, stock prices, currency exchange rates and commodity prices.

Model Risk. This is the potential for errors in the model's design, incorrect inputs, or misinterpretation of results.

Specific Product Risks. These are unique risks associated with financial products or instruments, such as derivatives, which carry risk of leverage (small movements in the underlying asset can lead to large gains or losses).

Investment risk information

The value of investments, and the income from them, may fall or rise and investors may get back less than they invested.

Past performance is not a reliable indicator of future results.

Some funds invest in emerging markets which can be more volatile than more established markets. As a result the value of your investment may rise or fall.

Investments in smaller companies may be more volatile than investments in well-established blue chip companies.

Funds investing in fixed interest securities carry the risk of default on repayment and erosion of the capital value of your investment and the level of income may fluctuate. Movements in interest rates are likely to affect the capital value of fixed interest securities. Corporate bonds may provide higher yields but as such may carry greater credit risk increasing the risk of default on repayment and erosion of the capital value of your investment. The level of income may fluctuate and movements in interest rates are likely to affect the capital value of bonds.

The Funds may use derivatives in order to reduce risk or cost and/or generate extra income or growth. The use of derivatives could increase or reduce exposure to underlying assets and result in greater fluctuations of the Fund's net asset value. A derivative is a financial contract whose value is based on the value of a financial asset (such as a share, bond, or currency) or a market index.

Some funds invest in securities which are denominated in different currencies. Movements in currency exchange rates can affect the return of investments.
