Market commentary

Vanguard LifeStrategy® 40% Equity MPS Global

As at 31 March 2025

Highlights

- 1 UK stagflation risks increased.
- 2 US trade tariff uncertainties started to weigh on markets.
- 3 Euro area eased fiscal rules.

In Q1 2025, the UK and US economies showed signs of weakening, while euro area activity marginally improved. Inflation remained above target in both the UK and US but was benign for the euro area. The European Central Bank (ECB) cut interest rates twice, the Bank of England (BoE) once and the US Federal Reserve (the Fed) kept interest rates unchanged.

Although the UK economy marginally expanded in Q4 2024, Q1 2025 data suggests weakness ahead. Elevated wage inflation remains a concern, with the latest annual wage growth at 5.9%. Annual headline inflation rose to 2.8% in February, up from 2.5% in December. The BoE cut rates from 4.75% to 4.50% in February on growth concerns.

In the US, the latest indicators suggested that trade tariff tensions were weighing on economic prospects. The latest inflation report in February also dampened investor sentiment. The Fed's preferred inflation measure, the annual Core Personal Consumption Expenditures (PCE) Price Index, which excludes food and energy costs, unexpectedly rose

from January's 2.7% to 2.8% in February. With inflation diverging from the Fed's 2% target, the central bank opted to keep its monetary policy unchanged, maintaining the federal funds rate target range at 4.25-4.50%.

The euro area's economic activity marginally improved in the final quarter of 2024. Surveys suggest that growth is set to continue into Q1 2025. The euro area also saw a significant fiscal turnaround in Q1, with the new German government announcing a large-scale spending plan to boost infrastructure and defence. Annual headline inflation in the euro region remained close to the ECB's 2% target, edging down from 2.4% in December to 2.2% in March. The ECB cut its policy rate by 50 basis points during the quarter, leaving its deposit rate at 2.50%.

In Q4 2024, China's economy grew by 1.6% (annualised). However, recent economic indicators suggest that growth is weakening. Inflation fell from 0.1% in December to -0.7% in February, raising concerns about deflation. Despite this, interest rates were unchanged.

Portfolio commentary

Vanguard LifeStrategy® 40% Equity MPS Global

As at 31 March 2025

Highlights

- 1** The LifeStrategy 40% Equity MPS Global Portfolio recorded a return of -1.10%.
- 2** US bonds outperformed.
- 3** US equities sold-off, while UK and Europe (ex-UK) stocks outperformed.

The LifeStrategy 40% Equity MPS Global Portfolio recorded a return of -1.10% in the first quarter of 2025.

The Portfolio's exposure to US equities was the main detractor from performance. Conversely, exposure to Europe (ex-UK) equities positively contributed to performance. Overall, fixed income contributed to the Portfolio's performance, with its global bond holding delivering a positive return. Exposure to both US government bonds and US corporate bonds made notable contributions.

In fixed income markets, the UK's weakened fiscal position and increased inflationary concerns led to UK government bond yields ending the quarter slightly higher. By contrast, global bonds, US government bonds and US investment-grade bonds made gains. A mix of tariff-related concerns, which fuelled an increased fear of a global downturn and disappointing US economic news boosted demand for US government bonds. Elsewhere, euro area government bonds sold off after Germany's announcement of higher government spending and Japan government bonds lagged after an interest-rate hiked in January and stronger-than-

expected economic growth. Overall, US government bonds and global bonds were the best performers.

US equities led a broader equity market sell off during the quarter. Early in the period, the US market posted steep declines after the release of a new artificial intelligence (AI) model by Chinese AI startup DeepSeek; ongoing concerns about the economic impact of trade tariffs also caused market volatility to jump during the quarter on increased recession risk and expectations of higher inflation. Meanwhile, Europe (ex-UK) and UK equities outperformed, benefitting from a combination of cheaper valuations and higher fiscal spending.

The US trade tariffs augur significant ramifications for economic activity and the lifting of inflationary expectations in the short term. Given the market turmoil, diversification across regions, sectors and asset classes is crucial. During this period of uncertainty, investors should continue to focus on their long-term goals.

Key investment risks

The value of equities and bonds can be affected by factors such as stock market movements, interest rates, credit spreads and volatility. Other driving factors include political, economic news, company earnings and significant corporate events. Movements in currency exchange rates can adversely affect the return of your investment.

Asset-Backed Risk. Investments in asset-backed securities, which are financial instruments backed by pools of assets such as mortgages, car loans, student loans or credit card receivables. The primary risk is borrowers defaulting on their loans, leading to investments losing value.

Credit Risk. This is the risk that a borrower or counterparty will default on their financial obligations, leading to a loss for the lender or investor. It is essentially the risk of not being repaid. Creditworthiness and economic conditions influence credit risk.

Foreign Investment Risk. This includes political risk (changes in government policies or instability), currency risk (foreign currency exchange rates) and economic risk (differences in economic

conditions and policies). All these can affect the value and performance of overseas investments.

Liquidity Risk. This is the risk of not being able to convert an investment into cash without a significant loss. Because the asset is illiquid, it is difficult to sell quickly. This hinders minimizing investment loss. Liquidity risk can be influenced by market conditions and the specific nature of the investment. Examples include real estate, private assets and emerging markets.

Market Risk. This is the potential for loss from market price movements. These include changes in interest rates, stock prices, currency exchange rates and commodity prices.

Model Risk. This is the potential for errors in the model's design, incorrect inputs, or misinterpretation of results.

Specific Product Risks. These are unique risks associated with financial products or instruments, such as derivatives, which carry risk of leverage (small movements in the underlying asset can lead to large gains or losses).

Investment risk information

The value of investments, and the income from them, may fall or rise and investors may get back less than they invested.

Past performance is not a reliable indicator of future results.

Some funds invest in emerging markets which can be more volatile than more established markets. As a result the value of your investment may rise or fall.

Investments in smaller companies may be more volatile than investments in well-established blue chip companies.

Funds investing in fixed interest securities carry the risk of default on repayment and erosion of the capital value of your investment and the level of income may fluctuate. Movements in interest rates are likely to affect the capital value of fixed interest securities. Corporate bonds may provide higher yields but as such may carry greater credit risk increasing the risk of default on repayment and erosion of the capital value of your investment. The level of income may fluctuate and movements in interest rates are likely to affect the capital value of bonds.

The Funds may use derivatives in order to reduce risk or cost and/or generate extra income or growth. The use of derivatives could increase or reduce exposure to underlying assets and result in greater fluctuations of the Fund's net asset value. A derivative is a financial contract whose value is based on the value of a financial asset (such as a share, bond, or currency) or a market index.

Some funds invest in securities which are denominated in different currencies. Movements in currency exchange rates can affect the return of investments.
